Rapid Evidence Synthesis: JBİ Evidence Summary Workshop

The **Rapid Evidence Synthesis: JBİ Evidence Summary Workshop** is a three-day workshop designed for clinicians, researchers, administrators, academics, managers, quality improvement personnel, students and others interested in learning how to develop a JBİ Evidence Summary.

This three-day workshop will provide participants with the opportunity to explore the pivotal role of evidence transfer in evidence-based practice and learn how clinical decision support resources enhance decision-making and promote continuous quality improvement.

Participants will gain hands-on experience with the principles of developing clinical decision support resources, specifically JBİ Evidence Summaries published in the JBİ EBP Database. Through comprehensive illustrations, expert guidance by trainers, and interactive activities, participants will immerse themselves in the JBİ methodology for creating impactful resources.

By the end of the program, participants will be able to:

- Discuss evidence-based healthcare concepts and the role of clinical decision support tools, such as JBİ Evidence Summaries, in transferring evidence to practice
- Identify a topic area and define a question for Evidence Summary development
- Search for and select the best available evidence to include in an Evidence Summary
- Summarise and present the information effectively
- Understand the principles of developing Best Practice Recommendations and audit criteria
- Discuss the importance of dissemination

“Are you a clinician or academic passionate about evidence-based healthcare, driven to support informed decision-making, and dedicated to improving patient outcomes?”
